

From the Edge: What Files Can be LAUNCHED?
Section: New Commands
Chapter: Running R:BASE Your Way!
Platform: R:BASE 2000 (version 6.5++) for Windows
Build: 1.842xRT03 and Higher

The new LAUNCH command in The Glorious R:BASE 2000 (ver 6.5++) has opened so many possibilities that sometimes we wonder what programs and/or files can be LAUNCHED...

Well, the answer is very simple!

Using your operating systems' Explorer, if you can double click on any file and it opens that doubled-clicked file with appropriate program...Bingo! You can open that file from within R:BASE 2000 (ver 6.5++) for Windows using the LAUNCH command. It's that simple.

Basically, when any program is installed, it usually has its proprietary or favorite file extensions. For example, .RB1 is the file association to LAUNCH R:BASE 2000 for Windows, .TXT for Windows NotePad, .PDF for Adobe Acrobat Reader, .DOC for MS Word .WPD for Corel WordPerfect, mailto: for your default e-mail program and so on ...
